Conditionals

If-then-else

A *conditional* is a test: 'if something is true, then do this, otherwise maybe do something else'. The C++ syntax is

```
if ( something ) {  
    do something;  
} else {  
    do otherwise;  
}
```

- The 'else' part is optional
- You can leave out braces in case of single statement.

Complicated conditionals

Chain:

```
if ( something ) {  
    ...  
} else if ( something else ) {  
    ...  
}
```

Nest:

```
if ( something ) {  
    if ( something else ) {  
        ...  
    } else {  
        ...  
    }  
}
```

Switch

```
switch (n) {  
  case 1 :  
  case 2 : cout << "very small" << endl;  
    break;  
  case 3 : cout << "trinity" << endl;  
    break;  
  default : cout << "large" << endl;  
}
```

Local variables in conditionals

The curly brackets in a conditional allow you to define local variables:

```
if ( something ) {  
    int i;  
    .... do something with i  
}  
// the variable 'i' has gone away.
```

Exercise 1

Read in an integer. If it's a multiple of three print 'Fizz'; if it's a multiple of five print 'Buzz'. If it is a multiple of both three and five print 'FizzBuzz'. Otherwise print nothing.

Project Exercise 2

Read two numbers and print a message like

`3 is a divisor of 9`

if the first is an exact divisor of the second, and another message

`4 is not a divisor of 9`

if it is not.
