Looping

Do loops

l:doloop

```
integer :: i
do i=1,10
  ! code with i
end do
```

You can include a step size (which can be negative) as a third parameter:

```
do i=1,10,3
  ! code with i
end do
```

While loop

I:whilef The while loop has a pre-test:

```
do while (i<1000)
   print *,i
   i = i*2
end do</pre>
```

Exit and cycle

I:loopexit

```
do
 x = randomvalue()
  if (x>.9) exit
  print *, "Nine out of ten exes agree"
end do
Skip rest of iteration:
do i=1,100
  if (isprime(i)) cycle
  ! do something with non-prime
end do
```

Implied do loops

l:implieddo

```
print *,(2*i,i=1,20)
```

You can iterate multiple expressions:

```
print *,(2*i,2*i+1,i=1,20)
```

These loops can be nested:
